Objective

The objective of this project is to analyze the Zomato restaurant dataset and identify trends in restaurant ratings, cuisines, locations, pricing, and customer preferences using data analytics and visualization techniques.

Tools and Technologies

- Python
- Pandas
- NumPy
- Matplotlib
- Seaborn
- WordCloud
- Jupyter Notebook

Visualizations Included

- Top Restaurant Locations
- Top Cuisines
- Online Order Analysis
- Rating Distribution
- Price vs Rating Analysis
- Correlation Heatmap
- Word Cloud

Executive Summary

This project performs Exploratory Data Analysis (EDA) on the Zomato Restaurant Dataset. The dataset was cleaned and processed using Python and Pandas. Various visualizations were created to understand customer preferences, restaurant distribution, cuisine popularity, pricing patterns, and rating trends.

The analysis revealed that a few locations contain the majority of restaurants, while North Indian and Chinese cuisines are among the most popular choices. Most restaurants have ratings between 3.5 and 4.5, indicating generally positive customer experiences. The correlation analysis showed that higher restaurant prices do not necessarily result in higher ratings.

Based on the findings, recommendations were proposed to improve restaurant visibility, customer engagement, and recommendation systems. The project demonstrates how data analytics can transform raw data into meaningful business insights and support decision-making.

Key Findings

1. Popular locations contain the highest number of restaurants.
2. North Indian and Chinese cuisines dominate the dataset.
3. Online ordering is widely available.
4. Most ratings fall between 3.5 and 4.5.
5. Price and rating have a weak correlation.

Recommendations

1. Focus marketing efforts on popular restaurant locations.
2. Promote highly rated restaurants with fewer votes.
3. Improve cuisine-based recommendations.
4. Encourage online ordering adoption.
5. Use ratings and votes for restaurant ranking.
